Title: V3C/V-PCC test model v21.0 user manual

Status: Draft

Purpose: User manualAuthor(s): Julien Ricard

julien.ricard@interdigital.com

Document: MPEG-wXXXXX

Source: 3DG

Abstract

This document is a user manual describing usage of reference software for the V3C/V-PCC project. It applies to version 21.0 of the software.

Contents

1 General Information

Reference software is being made available to provide a reference implementation of the V3C standard being developed by MPEG (ISO/IEC JTC 1/SC 29/WG 7). One of the main goals of the reference software is to provide a basis upon which to conduct experiments in order to determine which coding tools provide desired coding performance. It is not meant to be a particularly efficient implementation of anything, and one may notice its apparent unsuitability for a particular use. It should not be construed to be a reflection of how complex a production-quality implementation of a future V3C standard would be.

This document aims to provide guidance on the usage of the reference software. It is widely suspected to be incomplete and suggestions for improvements are welcome. Such suggestions and general inquiries may be sent to the general MPEG 3DGC email reflector at mpeg-3dgc@gti.ssr.upm.es (registration required).

1.1 Bug reporting

Bugs should be reported on the issue tracker set up at http://mpegx.int-evry.fr/software/MPEG/PCC/TM/mpeg-pcc-tmc2/issues.

2 Obtaining the software

2.1 Clone

The authoritative location of the software is the following git repository: http://mpegx.int-evry.fr/software/MPEG/PCC/TM/mpeg-pcc-tmc2

Each released version may be identified by a version control system tag in the form release-v21.0 [1].

An example:

```
$ git clone \
   http://mpegx.int-evry.fr/software/MPEG/PCC/mpeg-pcc-tmc2.git
$ cd mpeg-pcc-tmc2
```

It is strongly advised to obtain the software using the version control system rather than to download a zip (or other archive) of a particular release. The build system uses the version control system to accurately identify the version being built.

2.2 Building

The codec is supported on Linux, OSX and Windows platforms. The build configuration is managed using CMake.

It is strongly advised to build the software in a separate build directory.

2.2.1 Scripts

Bash scripts can be use to build mpeg-pcc-tmc2 project: - build.sh: build solutions.

- clear.sh: clear solututions (./clear.sh all: to clear dependencies)

2.2.2 OSX

```
$ mkdir build
$ cd build
$ cmake ..
$ cmake --build . --config Release --parallel 8
2.2.3 Linux
$ mkdir build
$ cd build
$ cmake ..
$ cmake --build . --config Release --parallel 8
2.2.4 Windows
$ md build
$ cd build
$ cmake ..
$ cmake ..
$ cmake --build . --config Release --parallel 8
```

2.2.5 External dependencies

According to the CMake options defined in the CMakeLists.txt, the TMC2 required some external dependencies to work:

- USE_JMAPP_VIDEO_CODEC: use JM software to encoder and decoder videos (codecId parameters must be set equal to 0 and the videoEncoderOccupancyPath, videoEncoderGeometryPath and videoEncoderAttributePath but be set the JM applications)
- USE_HMAPP_VIDEO_CODEC: use HM software to encoder and decoder videos (codecId parametesr must be set equal to 1 and the videoEncoderOccupancyPath, videoEncoderGeometryPath and videoEncoderAttributePath but be set the JM applications)
- USE_JMLIB_VIDEO_CODEC: use JM library to encoder and decoder videos (codecId parameter must be set equal to 2)
- USE_HMLIB_VIDEO_CODEC: use HM library to encoder and decoder videos (codecId parameter must be set equal to 3)
- USE_VTMLIB_VIDEO_CODEC: use VTM library to encoder and decoder videos (codecId parameter must be set equal to 4)
- USE_FFMPEG_VIDEO_CODEC: use FFMPEG library to encoder and decoder videos (codecId parameter must be set equal to 5). This mode is only available in the FFMPEG branch.
- USE_SHMAPP_VIDEO_CODEC: use SHM software to encoder and decoder videos (codecId parametesr must be set equal to 6, the videoEncoderGeometryPath and videoEncoderAttributePath using the SHM application, and the videoEncoderOccupancyPath using the HM application)
- USE_HDRTOOLS: use HDRTools to convert the raw video files.

The video encoder softwares and libraries can be found in the corresponding repositories:

- JM: https://vcgit.hhi.fraunhofer.de/jct-vc/JM.git
- HM: https://vcgit.hhi.fraunhofer.de/jvet/HM.git
- VTM: https://vcgit.hhi.fraunhofer.de/jvet/VVCSoftware_VTM.git
- SHM: https://vcgit.hhi.fraunhofer.de/jvet/SHM.git

Some changes have been made on these libraries to allow to use the three libraries at the same time and to increase the codec efficiencies for the V3C contents. the three codecs must be patch with the files:

- JM: dependencies/jm-modification/PCC_JM.patch
- HM: dependencies/hm-modification/pcc_me-ext_and_namespace_for_HM-16.20+SCM-8.8.patch

• VTM: dependencies/vtm-modification/adaptions_for_vtm_11_2.patch

By default according the the CMake options, the dependencies are cloned and patched by the cmake process.

The external dependencies could be downloaded, built and linked independenly.

JM:

```
$ git clone checkout \
       https://vcgit.hhi.fraunhofer.de/jct-vc/JM.git \
       dependencies/jm19.0_lib
   $ cd dependencies/jm19.0_lib
   $ git patch ../jm-modification/PCC_JM.patch
HM:
   $ git clone checkout \
       https://vcgit.hhi.fraunhofer.de/jvet/HM.git \
       dependencies/HM-16.20+SCM-8.8
   $ cd dependencies/HM-16.20+SCM-8.8
   $ git patch ../hm-modification/\
               pcc_me-ext_and_namespace_for_HM-16.20+SCM-8.8.patch
VTM:
   $ git clone checkout \
       https://vcgit.hhi.fraunhofer.de/jvet/VVCSoftware_VTM.git \
       dependencies/VTM-11.2
   $ cd dependencies/VTM-11.2
   $ git patch ../vtm-modification/adaptions_for_vtm_11_2.patch
HDRTools:
    $ git clone -b 0.17-dev \
       https://gitlab.com/standards/HDRTools.git \
       dependencies/HDRTools
```

The pointcloud metrics can be computed inside the TM2 encoder and decoder according to the input parameters:

- computeMetrics: Compute metrics
- uncompressedDataPath: Input pointcloud to encode. Multi-frame sequences may be represented by %04i
- normalDataPath: Input pointcloud to encode. Multi-frame sequences may be represented by %04i
- resolution: Specify the intrinsic resolution
- dropdups: 0(detect), 1(drop), 2(average) subsequent points with same coordinates
- neighborsProc: 0(undefined), 1(average), 2(weighted average), 3(min), 4(max) neighbors with same geometric distance

The computations of the metrics are the same than the distances computed with the pcc_distortion software that can be found in: http://mpegx.int-evry.fr/software/MPEG/PCC/mpeg-pcc-dmetric.git.

3 Using the codec

```
$ ../bin/PccAppEncoder [--help] [-c config.cfg] [--parameter=value]
$ ../bin/PccAppDecoder [--help] [--parameter=value]
$ ../bin/PccAppMetrics [--help] [--parameter=value]
```

3.1 Principle

The encoder takes as input a PLY file describing a point cloud with integer positions and, optionally, per-point integer colour attributes.

The output of the encoder is a binary bitstream encapsulated using the V3C annex-B format.

Conversely, the decoder takes as input a compressed bitstream file in V3C annex-B format and produces a reconstructed PLY file with position and any present attribute values.

The software may be configured using either command line arguments or from a configuration file specified using the -c|-config= option.

Sample configuration files are provided in the cfg/ directory.

Parameters are set by the last value encountered on the command line. Therefore if a setting is set via a configuration file, and then a subsequent command line parameter changes that same setting, the command line parameter value will be used.

3.2 Common test condition configurations

Configuration files are provided in the cfg directory to aid configuring the encoder. The general pattern of usage is illustrated below, where multiple configuration files control different aspects of the test conditions.

NB: parameters set in one configuration file override the same parameter in earlier files. ie. order matters.

Further help text describing option usage is available using ./bin/PccAppEncoder --help or ./bin/PccAppDecoder --help.

3.3 Examples

3.3.1 Encoder

The next command line encodes one streams:

```
$ ./bin/PccAppEncoder \
    --config=./cfg/common/ctc-common.cfg \
    --config=./cfg/condition/ctc-all-intra.cfg \
    --config=./cfg/sequence/queen.cfg \
    --config=./cfg/rate/ctc-r1.cfg \
    --colorTransform=0 \
    --configurationFolder=./cfg/ \
    --uncompressedDataFolder=./People/ \
    --colorSpaceConversionPath=HDRConvert \
    --videoEncoderPath=TAppEncoderHighBitDepthStatic \
    --videoEncoderOccupancyMapPath=TAppEncoderHighBitDepthStatic \
    --compressedStreamPath=./S22C2AI_queen/S22C2AIR01_queen.bin \
    --frameCount=32
```

To compute the metrics in the encode, the normal of the source point cloud must be given to the encoder. The next parameter must be added to the previous command:

```
--normalDataPath=./People/Technicolor/queen_n/frame_%04d_n.ply
```

3.3.2 Decoder

The next command line decodes one streams:

```
$ ./bin/PccAppDecoder \
    --startFrameNumber=0000 \
    --compressedStreamPath=./S22C2AIR01_queen.bin \
    --reconstructedDataPath=./S22C2AIR01_queen_dec_%04d.ply \
    --videoDecoderPath=TAppDecoderHighBitDepthStatic \
    --videoDecoderOccupancyMapPath=TAppDecoderHighBitDepthStatic \
    --colorSpaceConversionPath=./external/HDRTools/bin/HDRConvert \
    --inverseColorSpaceConversionConfig=\\
```

```
./cfg/hdrconvert/yuv420torgb444.cfg \
--nbThread=1 \
--colorTransform=0 \
```

To compute the metrics in the decoder, the normal of the source point cloud and the source PLY must be given to the decoder. The next parameter must be added to the previous command:

```
--config=./cfg/sequence/queen.cfg \
--uncompressedDataFolder=./People/ \
--normalDataPath=\\
./People/Technicolor/queen_n/frame_%04d_n.ply
```

3.3.3 Metrics

PccAppMetrics could be used to test the PccLibMetrics. For CTC experiments, it's sugested to used mpeg-pcc-dmetrics: http://mpegx.int-evry.fr/software/MPEG/PCC/mpeg-pcc-dmetric.git.

For example, mpeg-pcc-dmetric and PccAppMetric could be used with the next command line:

The two softwares give the same results.

3.3.4 Scripts

More examples of running could be found in ./test/runme_linux.sh.

These examples can be start based on your system with the following scripts: * ./test/runme_linux.sh * ./test/runme_windows.bat * ./test/runme_osx.sh

The V3C common test condition (CTC) command lines could be found in ./test/ctc_command_line.sh.

3.3.5 SHVC Information

The SHVC software used in the program can be obtained from the link below:

```
https://hevc.hhi.fraunhofer.de/svn/svn_SHVCSoftware/tags/SHM-12.4/
```

The additional Enhanced Layer will be used by SHVC codec according to the number of entries entered in the SHVCLayer in the encoder. SHVCRateX and SHVCRateY refer to the width and height resolution reduction rate of 2D images of additional layers. The decoder uses the video corresponding to the layer entered into the SHVCLayerID. LID 0 has the lowest density, and if 3 layers are used, LID 2 has the same density as V-PCC TMC2 output. Occupancy Map video encode/decode using same version of HM encooder/decoder.

SHVC Running 3layer PccAppEncoder

```
$ ./bin/PccAppEncoder \
    --configurationFolder=cfg/ \
    --config=cfg/common/ctc-common.cfg \
```

```
--config=cfg/condition/ctc-random-access-svc-3L.cfg \
--config=cfg/sequence/longdress_vox10.cfg \
--config=cfg/rate/ctc-r3.cfg \
--uncompressedDataFolder=Dynamic_Objects/People/ \
--frameCount=1 \
--videoEncoderGeometryPath=..\bin\TAppEncoder.exe \
--videoEncoderAttributePath=..\bin\TAppEncoder.exe \
--videoEncoderOccupancyPath=..\bin\occupancy\TAppEncoder.exe \
--colorSpaceConversionPath=../external/HDRTools/bin/HDRConvert \
--reconstructedDataPath=S26C03R03_rec_%04d.ply \
--compressedStreamPath=S26C03R03.bin \
--SHVCLayer=2 \
--SHVCRateX=2 \
--SHVCRateY=2
```

SHVC Running 3layer PccAppDecoder

```
--compressedStreamPath=S26C03R03.bin \
```

- --videoDecoderGeometryPath=..\bin\TAppDecoder.exe \
- --videoDecoderAttributePath=..\bin\TAppDecoder.exe \
- --videoDecoderOccupancyPath=..\bin\occupancy\TAppDecoder.exe \
- --colorSpaceConversionPath=../external/HDRTools/bin/HDRConvert \
- --inverseColorSpaceConversionConfig=\\
- cfg/hdrconvert/yuv420torgb444.cfg \
- --reconstructedDataPath=S26C03R03_dec_%04d.ply \
- --SHVCLayerID=2

3.4 General options

The next tables shows the parameters of the encoder, decoder and metrics programs.

3.4.1 Encoder parameters

Parameter=Value	Usage
help	This help text
Global	
config	Configuration file name
configurationFolder	Folder where the configuration files are
	stored, use for cfg relative paths.
uncompressedDataFolder	Folder where the uncompress input data are
	stored, use for cfg relative paths.
uncompressedDataPath	Input pointcloud to encode. Multi-frame
	sequences may be represented by %04i
compressedStreamPath	Output(encoder)/Input(decoder) compressed
	bitstream
reconstructedDataPath	Output decoded pointcloud. Multi-frame
	sequences may be represented by %04i
forcedSsvhUnitSizePrecisionBytes	forced SSVH unit size precision bytes
startFrameNumber	First frame number in sequence to
	encode/decode
frameCount	Number of frames to encode
groupOfFramesSize	Random access period
colorTransform	The colour transform to be applied:
	0: none
	1 D CD 11C1 C (D =00)
	1: RGB to YCbCr (Rec.709)

occupancyMapRefinement decodedAtlasInformationHash Enable decoded atlas information hash: 0. disable 1.MD5 2.CRC 3.Checksum	EOMFixBitCount	enhanced occupancy map fixed bit count
1.MD5 2.CRC 3.Checksum	occupancyMapRefinement	Use occupancy map refinement
attributeTransferFilterType Exclude geometry smoothing from attribute transfer		1.MD5 2.CRC 3.Checksum
	attributeTransferFilterType	Exclude geometry smoothing from attribute transfer

flagGeometrySmoothing	Enable geometry smoothing
neighborCountSmoothing	Neighbor count smoothing
radius2Smoothing	Radius to smoothing
radius2BoundaryDetection	Radius to boundary detection
thresholdSmoothing	Threshold smoothing
patchExpansion	Use occupancy map refinement
gridSmoothing	Enable grid smoothing
gridSize	grid size for the smoothing
thresholdColorSmoothing	Threshold of color smoothing
cgridSize	grid size for the color smoothing
thresholdColorDifference	Threshold of color difference between cells
thresholdColorVariation	Threshold of color variation in cells
flagColorSmoothing	Enable color smoothing
thresholdColorPreSmoothing	Threshold of color pre-smoothing
thresholdColorPreSmoothingLocal	Threshold of color pre-smoothing local
Entropy	entropy
radius2ColorPreSmoothing	Radius of color pre-smoothing
neighborCountColorPreSmoothing	Neighbor count for color pre-smoothing
flagColorPreSmoothing	Enable color pre-smoothing
bestColorSearchRange	Best color search range
numNeighborsColorTransferFwd	Number of neighbors creating Fwd list
numNeighborsColorTransferBwd	Number of neighbors creating Bwd list
useDistWeightedAverageFwd	Distance weighted average for Fwd list
useDistWeightedAverageBwd	Distance weighted average for Bwd list
skipAvgIfIdenticalSourcePoint	Skip avgeraging if target is identical to a
PresentFwd	Fwd point
skipAvgIfIdenticalSourcePoint	Skip avgeraging if target is identical to a
PresentBwd	Bwd point
distOffsetFwd	Distance offset to avoid infinite weight
distOffsetBwd	Distance offset to avoid infinite weight
maxGeometryDist2Fwd	Maximum allowed distance for a Fwd point
maxGeometryDist2Bwd	Maximum allowed distance for a Fwd point
maxColorDist2Fwd	Maximum allowed distance for a Bwa point Maximum allowed pari-wise color distance for
muxeofofDist21 wu	Fwd list
maxColorDist2Bwd	Maximum allowed pari-wise color distance for
man color lotal ma	Bwd list
excludeColorOutlier	Exclude color outliers from the NN set
thresholdColorOutlierDist	Threshold of color distance to exclude
an onoracororounororo	outliers from the NN set
videoEncoderOccupancyPath	Occupancy video encoder executable path
videoEncoderGeometryPath	Geometry video encoder executable path
videoEncoderAttributePath	Attribute video encoder executable path
videoEncoderOccupancyCodecId	Occupancy video encoder codec id
videoEncoderGeometryCodecId	Geometry video encoder codec id
videoEncoderAttributeCodecId	Attribute video encoder codec id
videoEncoderInternalBitdenth	Video encoder internal bitdenth
videoEncoderInternalBitdepth byteStreamVideoEncoderOccupancy	Video encoder internal bitdepth Attribute video encoder outputs byteStream
byteStreamVideoEncoderOccupancy	Attribute video encoder outputs byteStream
byteStreamVideoEncoderOccupancy byteStreamVideoEncoderGeometry	Attribute video encoder outputs byteStream Attribute video encoder outputs byteStream
byteStreamVideoEncoderOccupancy byteStreamVideoEncoderGeometry byteStreamVideoEncoderAttribute	Attribute video encoder outputs byteStream Attribute video encoder outputs byteStream Attribute video encoder outputs byteStream
byteStreamVideoEncoderOccupancy byteStreamVideoEncoderGeometry	Attribute video encoder outputs byteStream Attribute video encoder outputs byteStream

auxGeometryQP	QP for compression of auxiliary geometry
	video: default=4 for lossy raw points,
	geometryQP for lossless raw points
auxAttributeQP	QP for compression of auxiliary attribute video
geometryConfig	HM configuration file for geometry compression
geometry0Config	HM configuration file for geometry 0 compression
geometry1Config	HM configuration file for geometry 1 compression
attributeConfig	HM configuration file for attribute compression
attribute0Config	HM configuration file for attribute 0 compression
attribute1Config	HM configuration file for attribute 1 compression
rawPointsPatch	Enable raw points patch
noAttributes	Disable encoding of attributes
attributeVideo444	Use 444 format for attribute video
useRawPointsSeparateVideo	Compress raw points with video codec
attributeRawSeparateVideoWidth	Width of the MP's attribute in separate video
geometryMPConfig	HM configuration file for raw points geometry
geometryWir Comig	compression
attributeMPConfig	HM configuration file for raw points
aundutemrComig	attribute compression
nbThread	
	Number of thread used for parallel processing
keepIntermediateFiles	Keep intermediate files: RGB, YUV and bin
absoluteD1	Absolute D1
absoluteT1	Absolute T1
multipleStreams	number of video(geometry and attribute) streams
deltaQPD0	qp adjustment for geometry0 video: 0, +3, -3
deltaQPD1	qp adjustment for geometry1 video: 0, +3, -3
deltaQPT0	qp adjustment for attribute0 video: 0, +3, -3
deltaQPT1	qp adjustment for attribute1 video: 0, +3, -3
constrainedPack	Temporally consistent patch packing
levelOfDetailX	levelOfDetail: X axis in 2D space (should be
	greater than 1)
levelOfDetailY	levelOfDetail: Y axis in 2D space (should be
	greater than 1)
groupDilation	Group Dilation
offsetLossyOM	Value to be assigned to non-zero occupancy map
	positions (default=0)
thresholdLossyOM	Threshold for converting non-binary occupancy
·	map to binary (default=0)
prefilterLossyOM	Selects whether the occupany map is prefiltered
	before lossy compression (default=false)
shvcLayerIndex	Decode Layer ID number using SHVC codec
shvcRateX	SHVCRateX: reduce rate of each SHVC layer X
	axis in 2D space (should be greater than 1)
shvcRateY	SHVCRateY: reduce rate of each SHVC layer Y
	axis in 2D space (should be greater than 1)
patchColorSubsampling	Enable per patch color sub-sampling
maxNumRefAtalsList	maximum Number of Reference Atlas Frame list,
maxi vuniixeii itaisList	default: 1
maxNumRefAtlasFrame	maximum Number of Reference Atlas Frame per
maarvumixer/Auast taille	list, default: 1
pointLocalReconstruction	Use point local reconstruction
pomittocarreconstruction	Ose point local reconstruction

mapCountMinus1	Numbers of layers (rename to maps?)
singleMapPixelInterleaving	Use single layer pixel interleaving
removeDuplicatePoints	Remove duplicate points(
surfaceSeparation	surface separation
highGradientSeparation	Separate high gradient points from a patch
minGradient	Minimun gradient for a point to be separated
minNumHighGradientPoints	Minimum number of connected high gradient
	points to be separated from a patch
packingStrategy	Patches packing strategy(0: anchor packing,
	1(default): flexible packing, 2: tetris
	packing)
useEightOrientations	Allow either 2 orientations (0(default): NULL
	AND SWAP), or 8 orientation (1))
safeGuardDistance	Number of empty blocks that must exist between
	the patches (default=1)
attributeBGFill	Selects the background filling operation for
	attribute only (0: patch-edge extension,
	1(default): smoothed push-pull algorithm), 2:
	harmonic background filling
lossyRawPointsPatch	Lossy raw points patch(0: no lossy raw points
	patch, 1: enable lossy raw points patch
	(default=0)
minNormSumOfInvDist4MPSelection	Minimum normalized sum of inverse distance
	for raw points selection: double value
	between 0.0 and 1.0 (default=0.35)
globalPatchAllocation	Global temporally consistent patch
	allocation.(0: anchor's packing
	method(default), 1: gpa algorithm, 2: gtp
	algorithm)
globalPackingStrategyGOF	Number of frames to pack globally (0:(entire
	GOF))
globalPackingStrategyReset	Remove the reference to the previous frame
	(0(default), 1)
globalPackingStrategyThreshold	Matched patches area ratio threshold (decides
	if connections are valid or not, 0(default))
patchPrecedenceOrder	Order of patches
lowDelayEncoding	Low Delay encoding (0(default): do nothing,
	1: does not allow overlap of patches bounding
	boxes for low delay encoding)
geometryPadding	Selects the background filling operation for
	geometry (0: anchor, 1(default): 3D geometry
	padding)
apply3dMotionCompensation	Use auxilliary information for 3d motion
	compensation.(0: conventional video coding,
	1: 3D motion compensated)
usePccRDO	Use HEVC PCC RDO optimization
geometry3dCoordinatesBitdepth	Bit depth of geomtery 3D coordinates
geometryNominal2dBitdepth	Bit depth of geometry 2D
nbPlrmMode	Number of PLR mode
patchSize	Size of Patch for PLR
enhancedProjectionPlane	Use enhanced Projection Plane(0: OFF, 1: ON)

minWeightEPP	Minimum value
additionalProjectionPlaneMode	additional projection plane mode: 0:none
	1:Y-Axis 2:X-Axis 3:Z-Axis 4:All-Axis 5:apply
	to portion
partialAdditionalProjectionPlane	The value determines the partial point cloud.
	It's available with only
	additionalProjectionPlaneMode(5)
numMaxTilePerFrame	number of maximum tiles in a frame
uniformPartitionSpacing	indictation of uniform partitioning
tilePartitionWidth	uniform partition width in the unit of 64 pixels
tilePartitionHeight	uniform partition height in the unit of 64 pixels
tilePartitionWidthList	non uniform partition width in the unit of 64 pixels
tilePartitionHeightListnon	uniform partition height in the unit of 64 pixels
tileSegmentationType	tile segmentaton method: 0.no tile partition
	1. 3D ROI based 2.2D Patch size based
enablePointCloudPartitioning	enablePointCloudPartitioning
roiBoundingBoxMinX	roiBoundingBoxMinX
roiBoundingBoxMaxX	roiBoundingBoxMaxX
roiBoundingBoxMinY	roiBoundingBoxMinY
roiBoundingBoxMaxY	roiBoundingBoxMaxY
roiBoundingBoxMinZ	roiBoundingBoxMinZ
roiBoundingBoxMaxZ	roiBoundingBoxMaxZ
numTilesHor	numTilesHor
tileHeightToWidthRatio	tileHeightToWidthRatio
numCutsAlong1stLongestAxis	numCutsAlong1stLongestAxis
numCutsAlong2ndLongestAxis	numCutsAlong2ndLongestAxis
numCutsAlong3rdLongestAxis	numCutsAlong3rdLongestAxis
mortonOrderSortRawPoints	mortonOrderSortRawPoints
pbfEnableFlag	Enable patch block filtering
pbfFilterSize	pbfFilterSize
pbfPassesCount	pbfPassesCount
pbfLog2Threshold	pbfLog2Threshold
computeChecksum	Compute checksum
computeMetrics	Compute metrics
normalDataPath	Input pointcloud to encode. Multi-frame
normandatar atti	sequences may be represented by %04i
resolution	Specify the intrinsic resolution
dropdups	0(detect), 1(drop), 2(average) subsequent
diopaups	points with same coordinates
neighborsProc	0(undefined), 1(average), 2(weighted
neighborst foc	average), 3(min), 4(max) neighbors with same
	geometric distance
tionFlog	Tier Flag
rrofileCodecGroupIde	Profile Codec Group Idc
profileCodecGroupIdc	Profile Toolset Idc
profile Toolset Idc	
profileReconstructionIdc	Profile Reconstruction Idc
levelIdc	Level Idc
avcCodecIdIndex	Index for avc codec
hevcCodecIdIndex	Index for hevc codec
shvcCodecIdIndex	Index for shvc codec
vvcCodecIdIndex	Index for vvc codec

oneV3CFrameOnlyFlag	One V3C Frame Only Flag
0110 1 0 01 1 1 1 1 1 1 1 1 1 1 1 1 1 1	one to crimine only ring

3.4.2 Decoder parameters

Parameter=Value	Usage
help	This help text
Global	*
c,config	Configuration file name
compressedStreamPath	Input
1	compressed bitstream
reconstructedDataPath	Output decoded pointcloud. Multi-frame
	sequences may be represented by %04i
startFrameNumber	Fist frame number in sequence to
	encode/decode
colorTransform	The colour transform to be applied:
	0: none
	1: RGB to YCbCr (Rec.709)
colorSpaceConversion	Path to the HDRConvert. If unset, an
Path	internal color space conversion is
	used
inverseColorSpaceConversion	HDRConvert configuration file used for
Config	YUV420 to RGB444 conversion
videoDecoderOccupancyPath	Occupancy video decoder executable
videoDecoderGeometryPath	Geometry video decoder executable
videoDecoderAttributePath	Attribute video decoder executable
byteStreamVideoCoderOccupancy	Occupancy video decoder inputs byteStream
byteStreamVideoCoderGeometry	Geometry video decoder inputs byteStream
byteStreamVideoCoderAttribute	Attribute video decoder inputs byteStream
nbThread	Number of thread used for parallel
	processing
attributeTransferFilterType	Exclude geometry smoothing from attribute
	transfer
keepIntermediateFiles	Keep intermediate files: RGB, YUV and bin
shvcLayerIndex	Decode Layer ID number using SHVC codec
patchColorSubsampling	Enable per-patch color up-sampling
Metrics	
computeChecksum	Compute checksum
computeMetrics	Compute metrics
uncompressedDataFolder	Folder where the uncompress input data are
1	stored, use for cfg relative paths.
startFrameNumber	Fist frame number in sequence to
	encode/decode
frameCount	Number of frames to encode
groupOfFramesSize	Random access period
uncompressedDataPath	Input pointcloud to encode. Multi-frame
•	sequences may be represented by %04i
reconstructedDataPath	Output decoded pointcloud. Multi-frame
	sequences may be represented by %04i
normalDataPath	Input pointcloud to encode. Multi-frame
	sequences may be represented by %04i
resolution	Specify the intrinsic resolution
dropdups	0(detect), 1(drop), 2(average) subsequent
• •	

	points with same coordinates
neighborsProc	0(undefined), 1(average), 2(weighted
	average), 3(min), 4(max) neighbors with
	same geometric distance
nbThread	Number of thread used for parallel
	processing
minimumImageHeight	Ignore parameter
flagColorPreSmoothing	Ignore parameter
surfaceSeparation	Ignore parameter
Conformance	
checkConformance	Check conformance
path	Root directory of conformance files +
	prefix: S26C03R03_
level	Level indice
fps	Frame per second

3.4.3 Metrics parameters

Parameter=Value	Usage
help	This help text
computeChecksum	Compute checksum
computeMetrics	Compute metrics
startFrameNumber	Fist frame number in sequence to
	encode/decode
frameCount	Number of frames to encode
uncompressedDataPath	Input pointcloud to encode. Multi-frame
	sequences may be represented by %04i
reconstructedDataPath	Output decoded pointcloud. Multi-frame
	sequences may be represented by %04i
normalDataPath	Input pointcloud to encode. Multi-frame
	sequences may be represented by %04i
resolution	Specify the intrinsic resolution
dropdups	0(detect), 1(drop), 2(average) subsequent
	points with same coordinates
neighborsProc	0(undefined), 1(average), 2(weighted
	average), 3(min), 4(max) neighbors with
	same geometric distance
nbThread	Number of thread used for parallel
	processing
minimumImageHeight	Ignore parameter
flagColorPreSmoothing	Ignore parameter
surfaceSeparation	Ignore parameter
